

For the people, by the people!

Cancer: Development, Prevention, and Treatment

Preface

In 1993, I started working on a descriptive study about the increasing occurrence of cancer in the last few decades and changes occurring in society, with the idea that there had to be a logical connection between the two.

Over the years, and with unwavering determination, I obtained more and more scientifically sound pieces of this particular puzzle. Eventually I managed to piece the puzzles together into a whole, and learned what was happening, what was causing it, and how to prevent it.

Logic is usually defined by simplicity, followed by making things understandable. As if readers or listeners could have found the answers just as easily themselves. Things often turn out quite differently in practice, however. There is a tendency for our long-term thinking to be in the wrong direction (the Earth is flat...). That is, until someone finally manages to think *out of the box* enough, and the solution turns out to be so simple (the Earth is round) that everyone starts wondering why no one had come up with it before.

This is just how it is, and we have grudgingly accepted it.
